

Which paper proposes a novel method that could be utilized to attract the attention of, and ultimately communicate with, extraterrestrial intelligence?

The paper Transit light curve signatures of artificial objects proposes that transits could be a method of communicating or signaling to extraterrestrial life by using artificial planet-sized objects that transit their host star in a way that produces distinctive, non-natural light curve signatures. These artificial transits could serve as intentional, attention-getting signals detectable by civilizations monitoring planetary transits.
